AI Builder Cup 2026

Theme 5 · Future of Work & Enterprise Productivity

FlowHub

Everything your company sells, in one place.
Turned into cited, priced proposals by Gemini.

Our vision

Every company sells like it has a bid team.

- **AI Gemini** does the legwork: finds, researches, maps, drafts.
- **Code** keeps it honest: sources, prices, checks.
- **You** make the call, at every step.

Live on Google Cloud: `flowhub-331382621697.asia-southeast1.run.app`

The problem

Every deal needs the same six jobs.
Most teams still do them from scratch.

01
Find the lead
Skim the news, wait for a referral.

02
Research them
Twenty browser tabs, no time to check any.

03
Find the fit
Happens in one person's head.

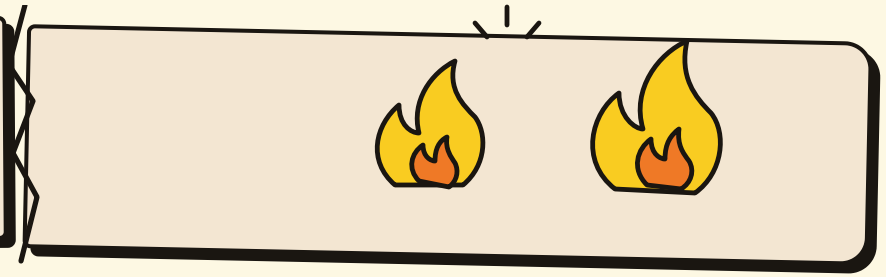

04
Price & propose
Copy last quarter's proposal, retype the prices.

05
Prep the pitch
Usually skipped. There's no time.

06
Follow up
Notes in a notebook, next steps forgotten.

Job zero: knowing what you sell.

It lives in old decks, a rate-card spreadsheet, past proposals and people's heads. When it's wrong or out of date, every job above it is wrong too.

Who feels it most

SMEs, startups and specialist firms, where the people who sell also deliver the work. No bid team, no sales ops, no spare hours.

28%

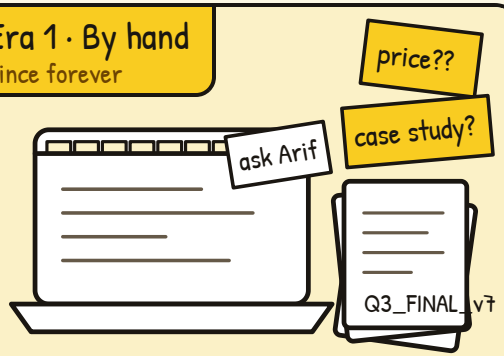

of a sales rep's week is spent actually selling.

Salesforce, State of Sales, 5th edition

How we got here

Lead conversion has had four eras.
Only the last one knows what you sell.

Era 1 · By hand
since forever

Spreadsheets & tabs

The rate card is a spreadsheet, proof is in a deck, research is twenty tabs, and the proposal starts from last quarter's.

The catch
Hours per deal. The know-how walks out with the people.

Era 2 · An app per job
circa 2010

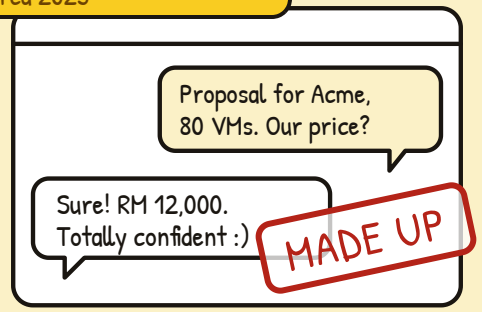

A tool for each step

CRM Salesforce, HubSpot · **Prospecting** Apollo, ZoomInfo · **Proposals** PandaDoc, Proposify · **RFPs** Loopio · **Calls** Gong, Otter

The catch
Six logins, six bills, built for big sales teams. Not one knows your price list.

Era 3 · Ask a chatbot
circa 2023

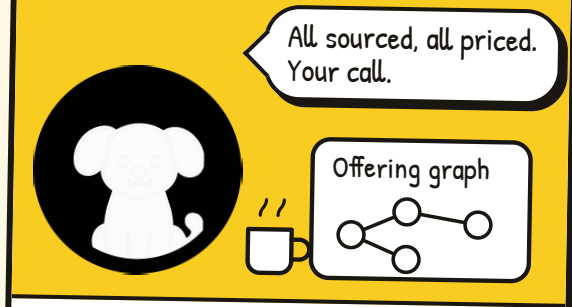

Smart, but not yours

Chat assistants ChatGPT, Claude, Gemini

Fast drafts and research, one chat at a time.

The catch
Knows the internet, not your catalogue. No sources, prices from thin air, context pasted in every time, stuck in one person's chat.

Era 4 · FlowHub
now, 2026

One hub, an agent team

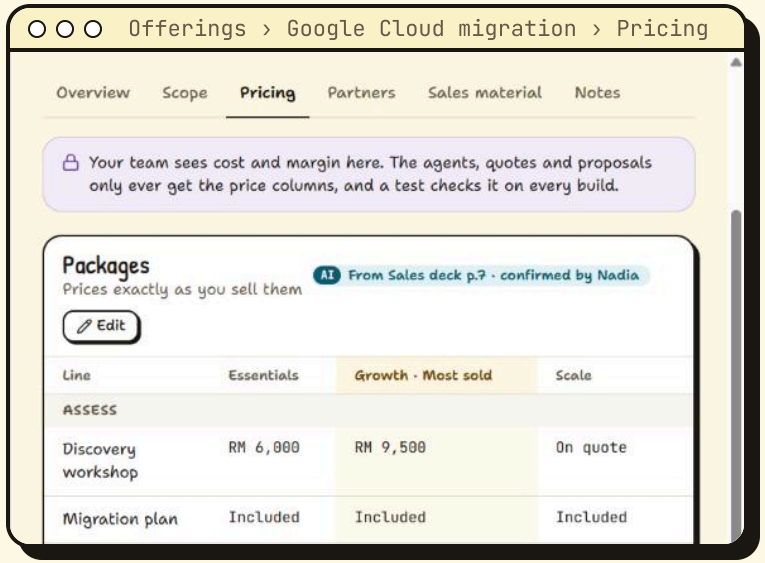

One trusted record of what you sell. Gemini agents work from it, with every claim cited and every price copied by code. A person approves each step.

What changes
Grounded · cited · priced by code · shared by the whole team.

The missing piece was never *more* AI. It was AI that works from a trusted record of what you sell, inside the work itself.

Meet FlowHub

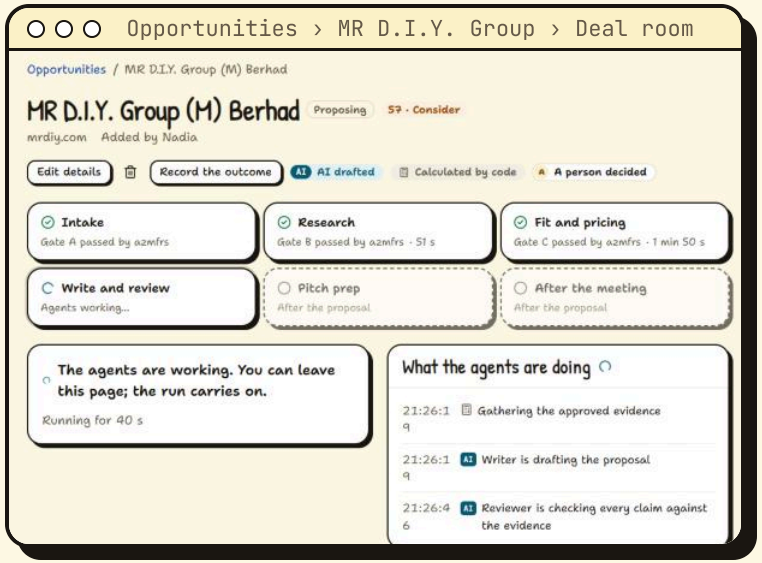

One hub for everything you sell, and an agent team that turns it into offers.

1 The hub

Know what you sell

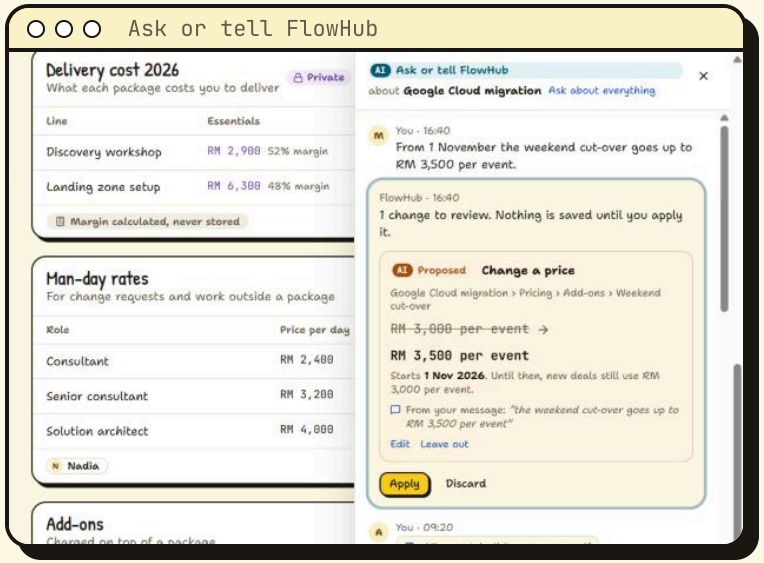

One page per offering, six tabs. Every price links to the page it came from, and cost stays private to your team.

2 The deal room

Turn a lead into an offer

Agents research the prospect, map needs to your offerings, price them and write the proposal, live, step by step.

3 You, at every gate

Nothing moves without a person

Tell FlowHub a price changed: it proposes the edit, you press Apply. Every block says who did it: AI **AI** Calculated or N **Nadia**.

Made to be used: Ask or tell from any screen (Ctrl+J) · Live progress, step by step · Real files: Docs, Slides, Gmail · A sample company in one click

Theme 5, decoded

We built FlowHub from the brief, phrase by phrase.

The theme

Future of Work & Enterprise Productivity

1. "individuals and organizations"
2. "access knowledge"
3. "collaborate"
4. "make decisions"
5. "complete everyday work"
6. "productivity, efficiency, knowledge accessibility, or workflow execution"

Phrases quoted from the Theme 5 description, aibuildercup.com

Every seller, and the whole company

One shared hub for the team. Each person in it gets a bid team's preparation for every deal.

The offering graph, with sources

Offerings, prices, results, partners and rules as typed data, each linked to its source page. Ask in plain words, get a cited answer.

Tell FlowHub, a teammate applies

Anyone says what changed. FlowHub proposes the edit in the right tab, and a person applies it. Every block shows who did what.

Fit map and a go/no-go score

Needs mapped to offerings, "Cannot meet" said out loud, a score computed in code, the company's selling rules enforced.

The real deliverables

A proposal in Google Docs, a client deck in Slides, an email ready in Gmail, pitch prep, and next steps from meeting notes.

Six jobs, one flow

From a news story to a reviewed, priced proposal in one sitting, with nothing retyped between steps.

GenAI across the journey

Gemini works every step. Code checks it. A person makes the call.

	Know what you sell	Find the lead		Win the deal			Close it		
	1 Keep the hub current	2 Scout the news	3 Intake	4 Research	5 Fit & pricing	6 Write & review	7 Doc, deck & email	8 Pitch prep	9 After the meeting
AI Gemini drafts, reads, searches	Turns a sentence or a PDF into typed changes. Flash + PDF reading + JSON schema	Four news searches at once, grouped into stories. Flash + Grounding	Reads an invite, email, RFP or website. Flash + JSON schema + URL context	Searches in parallel, reads their site, infers needs. Flash Argon + Grounding + URL context	Maps needs to offerings, then picks price lines. Argon Flash + Function calls	Writer drafts; Reviewer checks every claim. Argon + JSON schema	Writes the client deck and the email. Argon Flash	Pitch on a page, likely questions; marks practice. Argon Flash	Turns rough notes into next steps. Argon
Code checks, copies, scores	A price must appear word for word in its source.	Keeps sourced sentences; scores each lead.	Never guesses a company; checks page refs.	No grounding source, no claim. Drops are counted.	Exclusions first. Score by formula. Prices copied.	Renders prices; blocks unbacked claims and cost.	Drops any line no proposal claim backs.	Checks every amount against approved prices.	Keeps only points quoted from the notes.
You	Apply	Open a deal	Gate A confirm prospect	Gate B approve brief	Gate C edit the fit	Gate D decide flags	Send from your Gmail	Practise	Tick off steps

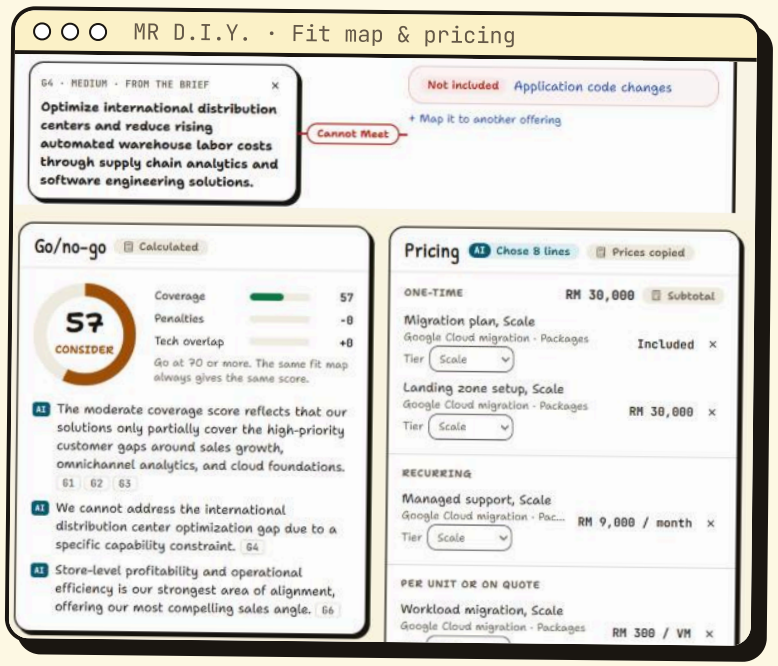

Every step leaves a trail: each AI and code step shows live in the deal room, and every gate records who passed it.

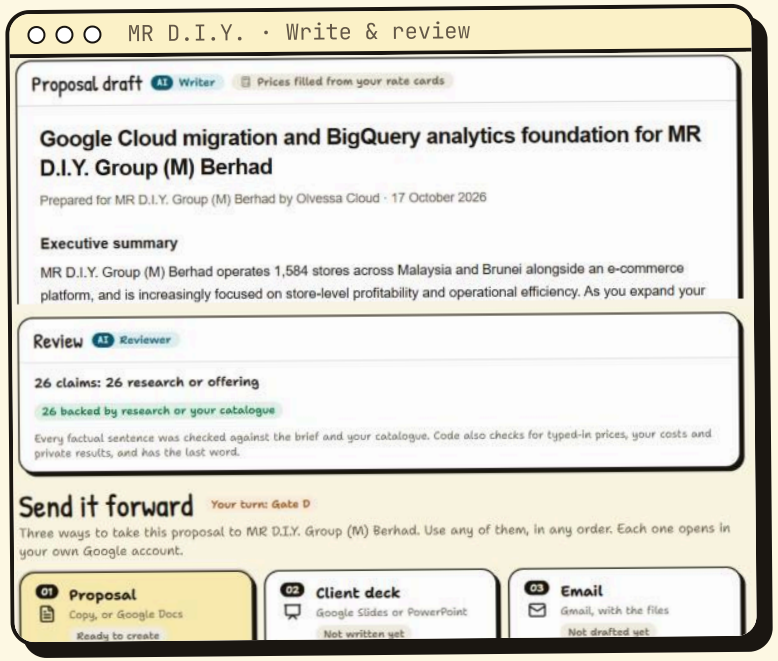

10	agent roles, orchestrated in code
2	Gemini models: 4 Argon to reason, 3.8 Flash for speed
5	Gemini capabilities, each where it fits
4	approval gates in every deal
0	prices typed by a model, or unsourced claims kept

GenAI, up close

One real deal: cited, priced and reviewed before you see it.

1 No source, no claim

14 facts from 18 sources, cut from Google Search grounding. 4 sentences had no source, so they were dropped and counted.

2 Honest fit, real prices

One need is marked "Cannot meet". The score is a formula: 57, Consider. The AI picked 8 price lines; code copied every price.

3 Reviewed, then yours

26 of 26 claims backed by research or the catalogue. An unbacked claim would block the Doc until a person decides.

Eval, real Gemini runs						
6 deals, 6 messages, 3 sellers · 16 Oct 2026	48/48 prices traced to a rate-card cell or fee line	9/9 planted unsupported claims caught	0/6 drafts with a cost amount in them	7/7 selling-rule and scope conflicts caught	31/32 needs mapped to the expected offering	6/6 Ask or tell messages, exactly the right changes

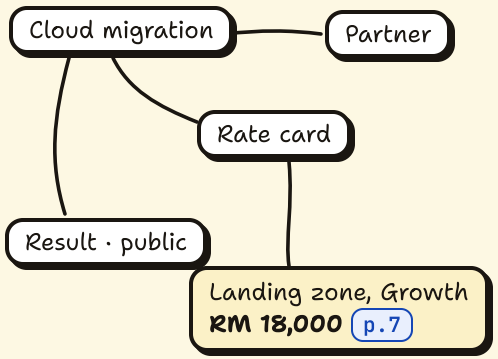

What's new here

Four ideas that make GenAI safe to sell with.

Idea 1

A catalogue the AI can cite

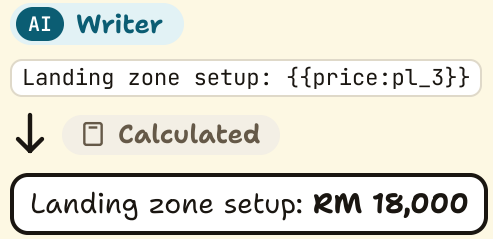

Not a folder of PDFs: an **offering graph** of typed offerings, rate cards, results, rules and partners. Each item keeps the page it came from. Agents read only what a person confirmed.

Idea 2

The model never types a price

The Pricing role **picks line IDs by function call**. The Writer leaves placeholders. Code copies the price and does every sum, and cost never reaches a model.

Idea 3

No source, no sentence

Research claims are **cut from Google Search grounding metadata** in code. A sentence with no grounding is dropped and counted, never hidden, and links stay exactly as Google returned them.

Idea 4

Who did what, on every block

Every block is marked **AI**, **Calculated** or **a person**. The model's output is kept untouched; people edit a working copy, locked at each gate. Trust you can see.

Under the hood

All on Google Cloud: one Cloud Run service, Gemini on Agent Platform.

Sales staff, in the browser

Gets live progress from Firestore listeners (dashed). Never writes to the database, never calls a model.

Openverse

Open-licence photos, credited

Their own Google Workspace

Docs proposal · **Slides** deck · **Gmail** draft they send. One `drive.file` token, used once, never stored.

Doc and Slides, at Finalise

Google Cloud · asia-southeast1

Cloud Run

One Next.js service: the app and every pipeline. Scales to zero.

UI

React, Tailwind, shadcn/ui. Live progress, never a write.

Server actions

The only writer: Zod checks, caps, audit trail.

Run-stage route

Called by Cloud Tasks only (OIDC), with IDs only.

Pipelines: 10 agent roles, orchestrated in code

TypeScript steps, each logged as AI or Calculated. Every run reads Firestore, writes back and ends: nothing kept in memory.

writes

queue, then OIDC call

every model call

Firestore

Offering graph, deal rooms, progress events. The system of record.

Cloud Tasks

Queues each deal-room stage and each PDF read, with safe retries.

Cloud Storage

Uploaded PDFs, read by Gemini directly.

Firebase Auth

Google sign-in. Every read is scoped to one workspace.

Gemini Enterprise Agent Platform

`4 Argon` Reasons: inferences, fit, writing, review, coaching, planning

`3.8 Flash` Fast: intake, PDF reading, grounded search, pricing picks, Ask or tell

- Google Search grounding
- URL context
- File understanding
- Structured output
- Function calling

Called through `@google/genai` with the service's own identity. Model names live in one file.

Ship & guard

Cloud Build → Artifact Registry → Cloud Run

GitHub Actions: lint, types, tests, schema

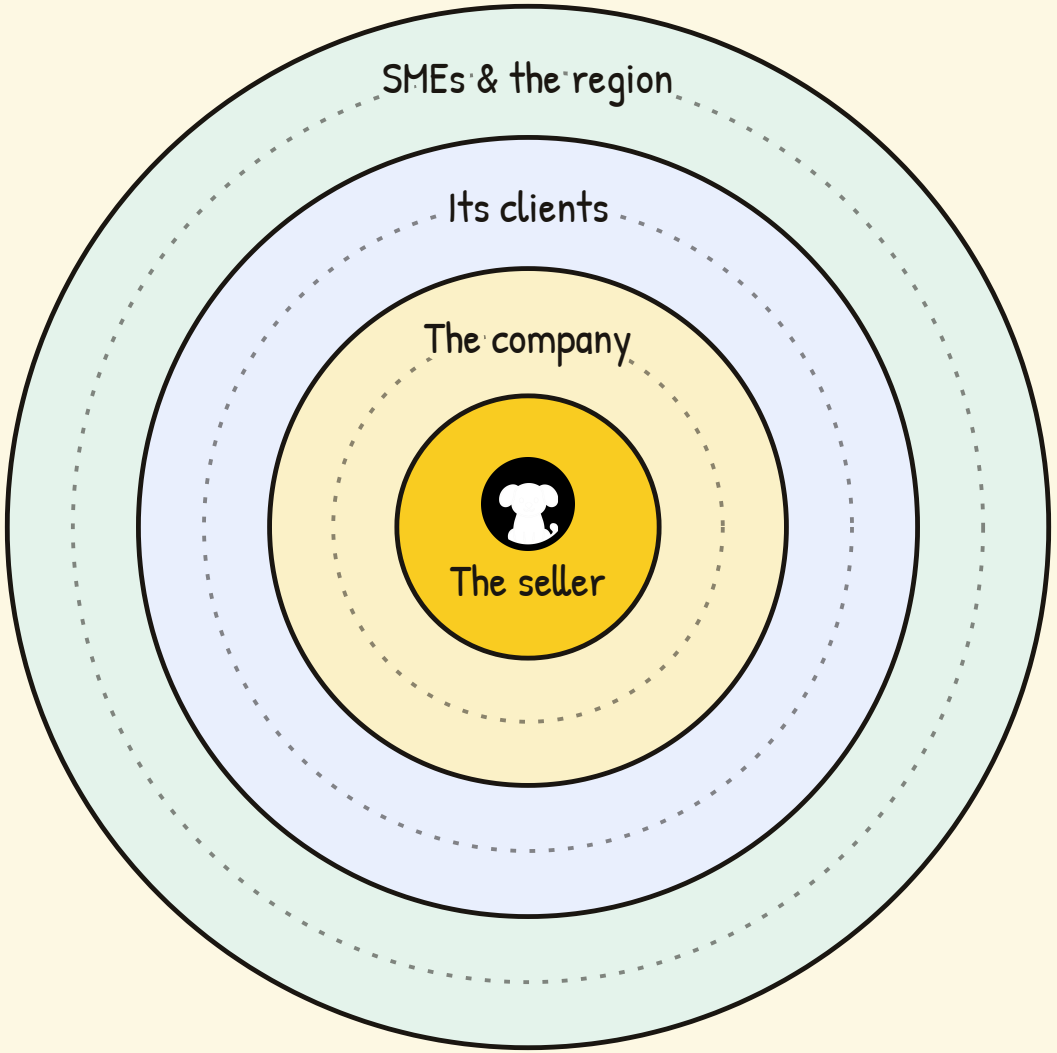

Budget alert

Daily caps, global ceiling

Kill switch

Impact

Better offers, for everyone around the deal.

The seller

Walks into every meeting ready: a cited brief, the fit, the prices, likely questions. Hours of tabs and retyping become one sitting, and the time goes back to the client.

The company

One trusted record of what it sells. Knowledge stays when people leave. Every offer is priced from this year's card, never shows cost, and never sells the roadmap as live.

Its clients

Proposals that answer their real needs, with sources they can check and an honest "we can't do this one, here's a partner who can".

SMEs & the region

96% of Malaysian businesses are MSMEs (DOSM, 2024). Most have no bid team. FlowHub gives them one, so they can answer tenders and enterprise RFPs like the big players.

Built to last

Ready to grow past the prototype.

Scales by design

Stateless, queued, isolated

- Every stage is a **stateless run**: read Firestore, write back, end. Nothing lives in memory between gates.
- **Cloud Run scales to zero** and out on demand. Cloud Tasks queues long stages and retries safely.
- Pipelines can move to their own worker service **with a deploy change**, not a rewrite.
- **Workspace isolation on every read.** The browser never writes; rules deny it.

One engine, any seller

A new company is data, not code

Olvessa Cloud
Services · priced by tier and man-day · 14 staff

Yorvex Workforce
Software · per employee per month, USD list · 86 staff

Trassoq Hardware
Products · volume bands, private buy price · 140 staff

Same agents, same proposal template, three very different catalogues. The offering graph imports and exports as a **versioned JSON Schema**, generated from the same Zod schema Gemini's structured output uses.

Sustainable to run

Costs bounded, quality guarded

60	1,500
AI runs per company per day	ceiling across all companies

- A **kill switch** pauses every agent without a redeploy. A **budget alert** watches spend.
- **Flash where speed matters, Argon where reasoning does**, so each call costs only what it needs.
- An **eval set on real Gemini runs** and unit tests in CI catch regressions before a release.
- Model names pinned in one file, so moving to the next Gemini is **a one-line change** plus the eval.

It compounds. Every document, note and won deal goes back into the hub. The news scout hunts for more clients like the ones you won, and the notes summary learns what sells and what loses.

What's next

Next: more autopilot, still with a person at every gate.

Built and live today

- The hub, Ask or tell, PDFs and scans
- News scout: today's paper of sourced leads
- Deal room: intake to reviewed proposal
- Google Doc, Slides deck, Gmail draft
- Pitch prep with marked practice
- Next steps from meeting notes

Next

The morning paper, on its own

The news scout runs every morning on a schedule, so fresh, scored leads are waiting when the team logs in.

Next

Quotes, clients and team roles

Quotes with approval, client records, and Owner, Editor and Viewer roles, already in the data model.

Next

A mock meeting, out loud

Rehearse the pitch by voice with Gemini Live playing the client, briefed on the real deal, then get marked.

Later

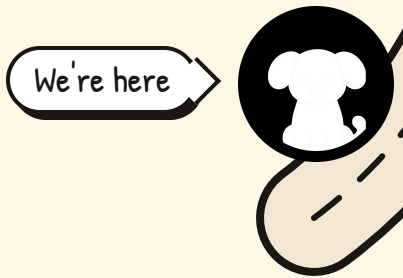

Agents that follow through

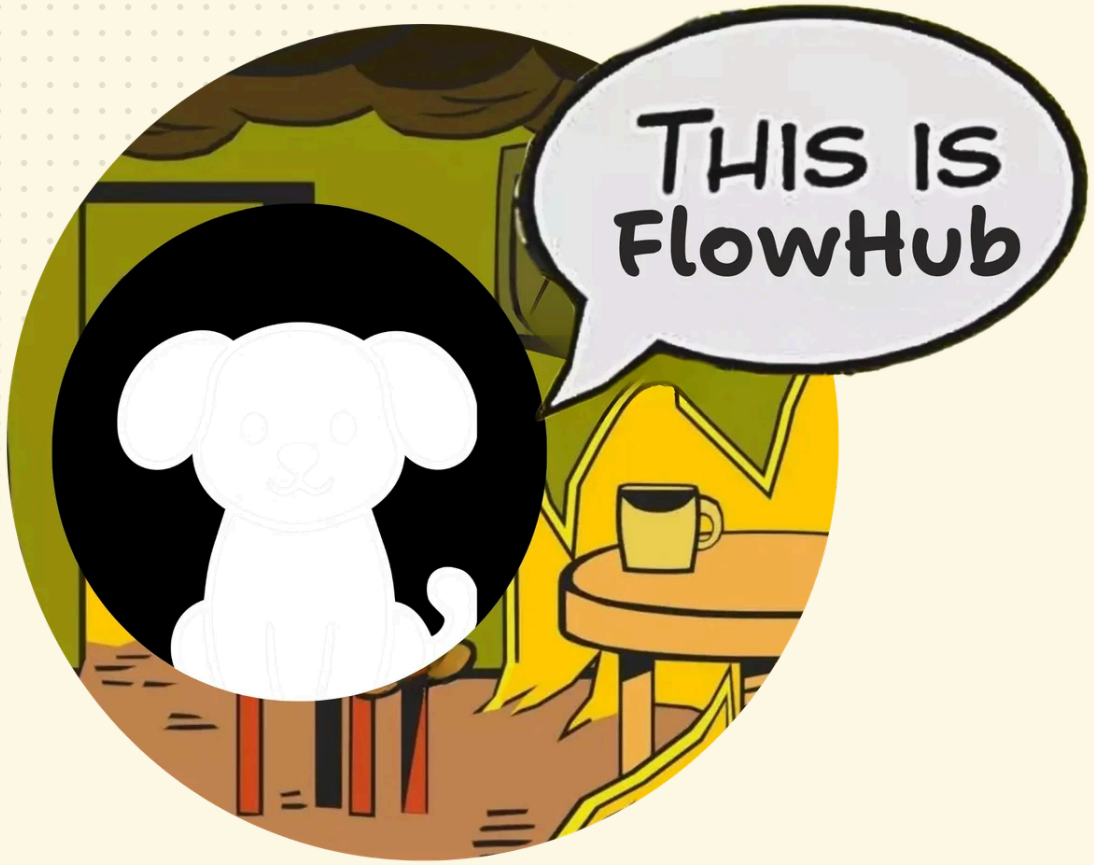

Agents that chase next steps, draft supplier asks and learn from wins and losses. Each change is still applied by a person.

Later

Tenders, languages, connectors

Compliance matrix and bid/no-bid. Malay, Chinese and Bahasa Indonesia. Calendar, inbox and CRM intake.

The chaos is real. FlowHub stays calm.

AI Gemini does the legwork.

Code keeps it honest.

Y You make the call.

Try it yourself in five minutes

1. Sign in with Google and press **Try with sample data**.
2. Pick **Olvessa Cloud**. MR D.I.Y. is waiting at Gate A.
3. Press **Research this prospect** and watch a cited brief build live.
4. Approve each gate: fit, prices, then a reviewed proposal.
